The goal of this lesson is for students to interact more with multiple representations of uniform accelerated motion. Students have worked and practiced with the new acceleration graphs and motion maps, but in this lesson my aim is for them to explain the graphs and what is happening to an accelerating object.

Uniformly Accelerated Motion Model Worksheet1 Answers PDF

Introduction This study focused on an object in motion with a uniform acceleration. Using the Motion Encoder System and LoggerPro, the position, velocity, and time were taken and analyzed with the goal to determine linear and quadratic acceleration. Interpreting the graphs allowed discovery of the affect of acceleration due to Earth's gravity.

Representations of Motion . Introduction The motion of an object can be represented in various ways. These representations include: • Verbal Description Example: The ball is moving in the positive direction (to the right) and it is speeding up. • Equations Example: $x=3(m/s^2)t^2+2(m/s)t+5(m)$ This is the equation of motion for an object

Acceleration is the rate of change of displacement with time. To find acceleration, calculate the slope in each interval. Plot these values as a function of time. Since the acceleration is constant within each interval, the new graph should be made entirely of linked horizontal segments. Displacement is the product of velocity and time.

Graphs of Motion - Practice - The Physics Hypertextbook

Links to Chemistry: Displacement and 1- and 2-dimensional motion may be used in showing conceptual representations of atoms and molecules during reactions. When studying the motion of electrons around the nucleus, velocity and acceleration can be discussed to show how the electron changes speed when it encounters another electron or proton.
