An Examination Of Two Methodological

Previous research has provided evidence for the notion that there are varying levels of inconsistency between individuals when responding to questionnaires with multiple response items. Specifically, there are individual differences in how consistently persons respond to items from the same dimension in a questionnaire (Reddock, Biderman & Nguyen, 2011).

An examination of the differences between two methods of estimating energy expenditure in resistance training activities. To date, few studies have looked at the energy expenditure (EE) of individual resistance training (RT) exercises. The purpose of this study was to evaluate the EE of 4 modes of RT (push-ups, curl-ups, pull-ups, and lunges) using 2 different calculation methods for estimating EE.

Different Exam Types - Different Approaches

The first method examined the traditionally measured aerobic values of each activity, whereas the second method examined the EE observed during the immediate postactivity recovery time . In our study, the recovery method yielded significantly higher values for EE than did values obtained with traditional measures ($p < 0.001$). The EE calculated from the recovery method indicated that 3 of the 4 modes of RT may be perceived as vigorous-intensity activity (>6 METs), whereas the traditional ...
