Lathe Operations

A lathe is a machine that rotates the workpiece about an axis to perform different operations such as turning, facing, taper turning, knurling, grooving, parting off, thread cutting, reaming, etc. Let's discuss all lathe machine operations one by one as follows.

Basic Lathe Operations | Lathe operation Explained. Lathe is a machine tool which causes workpiece to revolve so that when cutting tool comes in contact with the workpiece it removes the metal in the form of chips. Workpiece can be held securely and rigidly on the machine tool between centres or by means of chuck.

Lathe Machine Operations Manual - Mechanical Engineering

A lathe is a machine that rotates the piece on the axis in order to perform various operations like cutting, facing, knurling, deformation and more. Metal spinning, thermal spraying, woodturning and metalworking are the common operations performed with a lathe machine.

Lathe, Lathe Operations Types & Lathe Cutting Tools

Some of the most common operations done in lathe machines are facing, tapering, contour turning, chamfering, boring, drilling, and threading. The most prominent parts of a lathe machine are the headstock and the tailstock. The headstock is located on one end of the machine and contains spinning bearings, inside of which is a horizontal axle.

The HI/LO range lever on the back of the headstock should be in the LO range for just about all machining operations other than polishing. Set the leadscrew direction on the back of the headstock in the neutral (center) position for now. If its not already on, turn on the power to the lathe using the red rocker switch.

Turning Operations - mini-lathe.com

Lathe cutting tools brought to the work may move in one or more directions. Tool movement on the engine lathe is accomplished using a combination of the lathe's "carriage", "cross slide", and "compound rest". The carriage travels along the machine's bedways, parallel to the workpiece axis. This axis is known as the "Z" axis.

Turning and Lathe Basics - Manufacturing

A lathe is a large machine that rotates the work piece about its axis of rotation and cutting is done using a non rotating singular cutting tool. The cutting tool is hold stationary and the work piece is moved according to the desired cutting work. Metal working and wood turning are the common operations done in a lathe machine.

Lathes are highly accurate machine tools designed to operate around the clock if properly operated and maintained. Lathes must be lubricated and checked for adjustment before operation. Improper lubrication or loose nuts and bolts can cause excessive wear and dangerous operating conditions.

INSTRUCTIONS TO LEARN HOW TO USE A LATHE

Facing Operations. Facing is the process of removing metal from the end of a workpiece to produce a flat surface. Most often, the workpiece is cylindrical, but using a 4-jaw chuck you can face rectangular or odd-shaped work to form cubes and other non-cylindrical shapes.. When a lathe cutting tool removes metal it applies considerable tangential (i.e. lateral or sideways) force to the workpiece.
