### Short Term Load Forecasting Using

In short term load forecasting, the aim is to estimate the load for the next half hour up to the next two weeks. For aggregated household demand, many different methods are proposed and tested (see e.g. Alfares and Nazeeruddin , Taylor and Espasa , Hong and Fan , etc.). Aggregating the data smooths it, therefore makes it easier to forecast.

Short Term Power Load Forecasting using Machine Learning Models for energy management in a smart community. Abstract: The short-term power load prediction of single households is a challenging issue in the research fields of Smart Grid (SG) management/planning, viable energy usage, energy saving and the bidding system design of electricity market. The reason for this is the unpredictability and uncertainty in electricity consumption pattern of individual household.

securely, and economically. The short-term load forecast (STLF) represents the electric load forecast for a time interval of a few hours to a few days. This thesis will define STLF as a 24-hour-ahead load forecast whose results will provide an hourly electric load forecast in kilowatts (kW) for the future 24 hours (a 24-hour load profile).
