a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit. In an internal combustion engine, the expansion of the high-temperature and high-pressure gases produced by combustion applies direct force to some component of the engine.

Internal combustion engine. The internal combustion engine is an engine in which the burning of a fuel occurs in a confined space called a combustion chamber. This exothermic reaction of a fuel with an oxidizer creates gases of high temperature and pressure, which are permitted to expand. The defining feature of an internal combustion engine

The internal combustion (IC) engine is a class of heat engine wherein the chemical energy of fuel is transformed into shaft work. It is so named because combustion occurs inside a combustion chamber that is an integral part of the working fluid flow circuit.
