In a delta connected (Δ) group of transformers, the line voltage, V_L is equal to the supply voltage, V_S . But the current in each phase winding is given as: $1/\sqrt{3} \times I_L$ of the line current, where I_L is the line current. One disadvantage of delta connected three phase transformers is that each transformer must be wound for the full-line voltage, (in our example above 100V) and for ...
